Analysis you can act on

Deep, traceable regulatory analysis for insurance

Solvance reads the regulation article by article, the way an experienced compliance specialist would.

The text is structured into answerable requirements, each requirement is mapped to the roles that must own it, your policy documents are tested against them, and the gaps are named. Every conclusion traces back to the exact paragraph it rests on.

What the analysis contains

- **Requirement structuring.** The regulation broken down article by article into answerable requirements.
- **Ownership mapping.** Which roles must own each requirement, with reading lists.
- **Gap analysis.** Your policy documents tested against the requirements, with drafted wording.
- **Best practice and synthesis.** Several frameworks read together, every document assessed against good practice.
- **LUMI.** Open search across your own analysis, citing the exact passage the answer comes from.

Around twenty frameworks in place

Solvency II, DORA, IDD, IRRD, the EU AI Act and the relevant anti money laundering frameworks, with applicable national law.

Two weeks from approved risk profile to delivered analysis.

One working hour is your whole effort to get started.

No integration against your systems is required.

The compliance year

The first analysis becomes a living baseline where every article is tested against every role and every policy. Three cadences keep it current.

- **On change.** A new run is scheduled when a framework is added or amended, and when one of your policies changes.
- **Quarterly.** Gaps, recommendations and board ready material on the cycle you already run.
- **Daily.** The reference layer: role dossiers, policy views and open search.

The analysis exists before the question

A tool that writes the answer at the moment you ask can only weigh what it happened to retrieve. Solvance works the other way round: the whole framework is analysed against all of your material before anyone asks. Five things follow from that.

- **The context is in from the start.** Your risk profile, your roles and your documents are counted in when the analysis is made, not when the question is put.
- **Every article is answered.** No article is left unanswered, so you can show that the whole framework is covered.
- **Every answer traces back.** From conclusion to paragraph, and on to the passage in your own document. Material you can put in front of internal audit and the supervisor.
- **The right version, the right date.** Every analysis belongs to the version of the framework and the policy document it was made against.
- **We say so when the material is not enough.** If it does not support a conclusion we write that plainly. No gaps filled with text that looks like an answer.

How we start

We work on a subscription model and begin with a first analysis of one framework you choose.

1 **You choose the framework.** Solvency II, DORA, the AI Act or another one.

2 **You hand over the material.** Review a parameter document, answer a few questions and share a handful of policy documents.

3 **We deliver in two weeks.** The full analysis in Prism, with drafted wording and open search.

4 **The library grows.** Framework by framework, at your pace.

The decisions are always yours, made by you and supported by the analysis.
